Abstract

- We present a theoretical model predicting racially biased policing produces 1) more use of potentially lethal force by firearms against Black civilians than against White civilians and 2) lower fatality rates for Black civilians than White civilians. We empirically evaluate this second prediction with original officer-involved shooting data from nine local police jurisdictions from 2005 to 2017, finding that Black fatality rates are significantly lower than White fatality rates, conditional upon civilians being shot by the police. Using outcome test methodology, we estimate that at least 30% of Black civilians shot by the police would not have been shot had they been White. We also show that an omitted covariate three times stronger than our strongest included covariate would only reduce this estimate to 18%. Additionally, such an omitted covariate would have to affect Black fatality rates and not Hispanic fatality rates in order to be consistent with the data.

Clark, T.S. *et al.* (2023) “Are police racially biased in the decision to shoot?” *The Journal of Politics* [Preprint].

- The research shows that the effect of civilian race has on the likelihood of a police officer shooting a civilian.
- “Our logic implies that if officers have a lower threshold for deciding to shoot Black civilians than White civilians, then there will be a greater proportion of Black civilians who will choose to not threaten and, therefore, survive an officer-involved shooting”

Officer shootings per month

This is the percent of fatal shootings based on civilian race

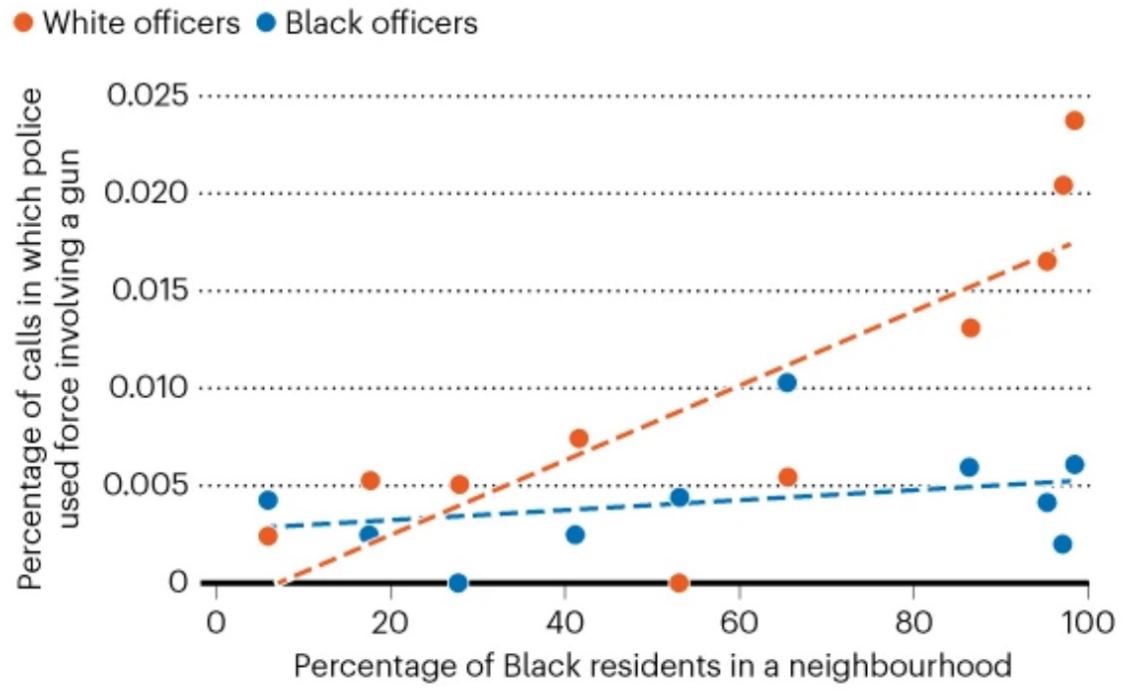

- White Black Hispanic Asian/AI/AN/PI
- 0 0.48 0.67 0.42 0.27
- 1 0.52 0.33 0.58 0.73

The original vs replication

- The dataset includes a wide range if data but the studies focus is on
- fatal or not
- Race-Asian,Black,White or Hispanic
- The city Charlotte, Houston ,King County,Los Angeles,Orlando, San Jose,Seattle,Tucson
- Distance from a trauma center(hospital)
- Replication
- In my replication I ran the model, but I added a new variable, the race of the police officer to the fixed effect additive model

Officer Race and shooting

Does it matter?

Yes-It does in a lot
of datasets
including this one
from 2020

©nature

(Hoekstra & Sloan, 2020)

Replication twist-Surely officer race matters?

I created a new alternative dataset that included the race variable for police.

I then adjusted the functions made by the authors to enable this change to run

To align with methodology used where they ran 4 models each with an extra variable, I did similarly adding a 5th model which included this new variable and reran all new code

Fixed effect glm for original and replication

Adapting sensitivity function

- The estimate.poisson.rhoU2 function is estimating a Poisson regression model with log link and using the confounder variable as the predictor of interest, with White, Houston, King_County, Los_Angeles, Orlando, San_Jose, Seattle, Tucson, and trauma10 as covariates. The function returns the fitted Poisson regression model.
- The bias.factor function calculates the bias factor based on the ratio of the unmeasured confounding effect (represented by RR_rhoU) and the observed exposure effect (represented by RR_UY).
- The cluster.pois2 function appears to be fitting a clustered Poisson regression model using the fepois function, with fatal, White, trauma10, and city_factor as predictors. The function returns the estimated coefficients of the fitted model. The indices argument likely refers to the indices of the observations in the data set that belong to the same cluster.

Code

- This is only a snippets of most relevant changes to code made
- To run my changes run I created 4 new code files polrace3,4,5 and polracs function each mirroring part 3,4,5 and the sensitivity function of the original code

Conclusion

The authors did not include the officer race and as all the statistics show they were right not to.

This dataset would indicate that the race of the officer is not statistically significant or have any notable impact on the dataset as far as I can prove.

Given the evidence for officer race not being a relevant factor and evidence from the study mentioned earlier I am left unsure of what to make of the officer race factor.
